

Switching Between Personal and Company Git Accounts (WITHOUT SSH)

This document explains how to safely switch between Personal Git and Company Git accounts on the same Windows machine using HTTPS and Personal Access Tokens (PAT).

Key Concepts

- GitHub does NOT support passwords for Git operations
- Personal Access Tokens (PAT) are used instead of passwords
- git config user.name and user.email only control commit author
- Switching accounts depends on repo folder and cached credentials

Golden Rule: The folder you are in decides which Git account is used.

One-Time Setup (Per Repository)

Personal Repository

```
git config user.name "bindhuS7"  
git config user.email "sb661261@gmail.com"
```

Company Repository

```
git config user.name "bindhu.s"  
git config user.email "bindhu.s@levisofttech.com"
```

Creating a Personal Access Token (GitHub)

- GitHub → Settings → Developer settings
- Personal access tokens → Tokens (classic)
- Generate new token (classic)
- Select scope: repo
- Copy the token immediately (shown only once)

Switch to PERSONAL Git Account

- Open Git Bash and go to personal repo folder
- Verify remote URL points to personal GitHub repo
- Open Control Panel → Credential Manager → Windows Credentials
- Remove git:https://github.com entries
- Run git push and login with personal username + personal token

Switch BACK to COMPANY Git Account

- Open Git Bash and go to company repo folder
- Verify remote URL points to company repo
- Remove cached GitHub credentials from Credential Manager
- Run git push and login with company username + company token

Common Errors

- 403 Permission Denied: Wrong account token cached
- Fix: Remove credentials and login again with correct token

Summary

You can safely switch between Personal and Company Git accounts anytime on the same machine without SSH by using HTTPS, Personal Access Tokens, and per-repo configuration.
